

Examples

Dr. Jyotismita Chaki

ER Diagram: 1

- Consider the following requirements list:
 - The airline has one or more airplanes.
 - An airplane has a model number, a unique registration number, and the capacity to take one or more passengers.
 - An airplane flight has a unique flight number, a departure airport, a destination airport, a departure date and time, and an arrival date and time.
 - Each flight is carried out by a single airplane.
 - A passenger has given names, a surname, and a unique email address.
 - A passenger can book a seat on a flight.

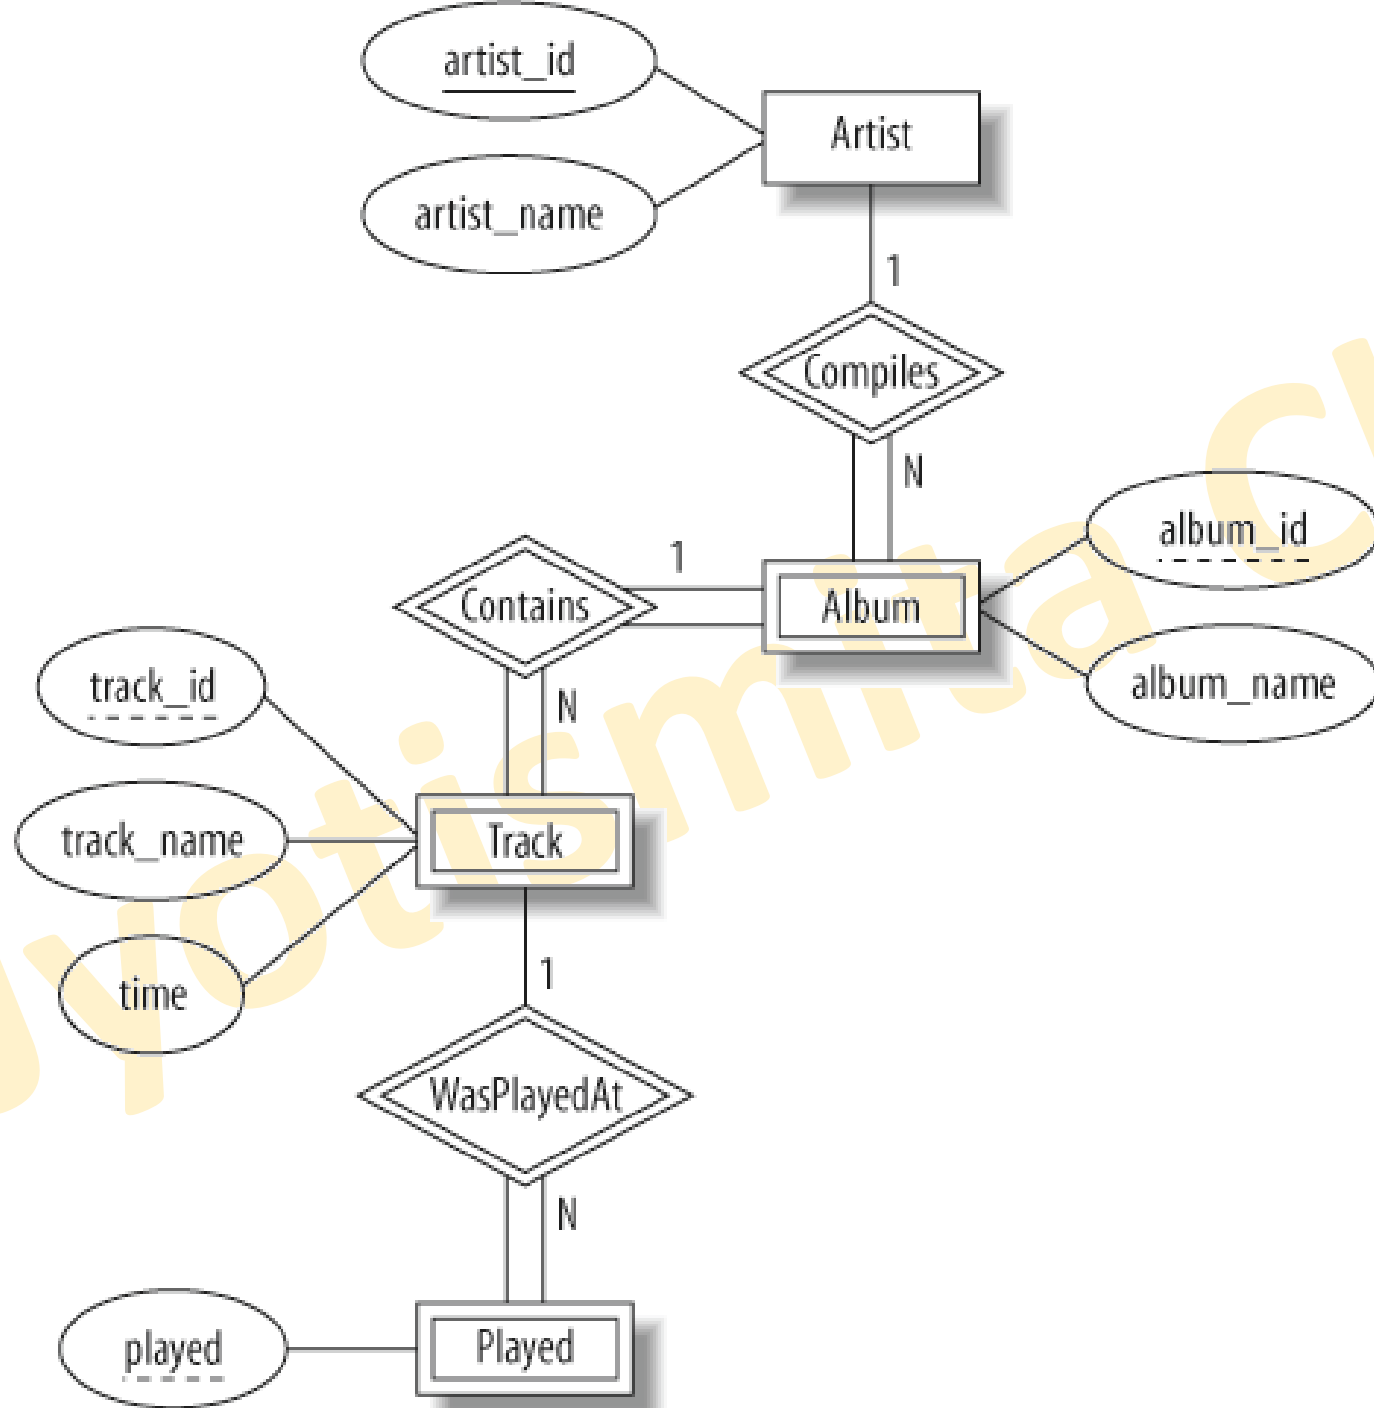

Solution

ER Diagram: 2

- Requirements for the music database:
 - The collection consists of albums.
 - An album is made by exactly one artist.
 - An artist makes one or more albums.
 - An album contains one or more tracks
 - Artists, albums, and tracks each have a name.
 - Each track is on exactly one album.
 - Each track has a time length, measured in seconds.
 - When a track is played, the date and time the playback began (to the nearest second) should be recorded; this is used for reporting when a track was last played, as well as the number of times music by an artist, from an album, or a track has been played.

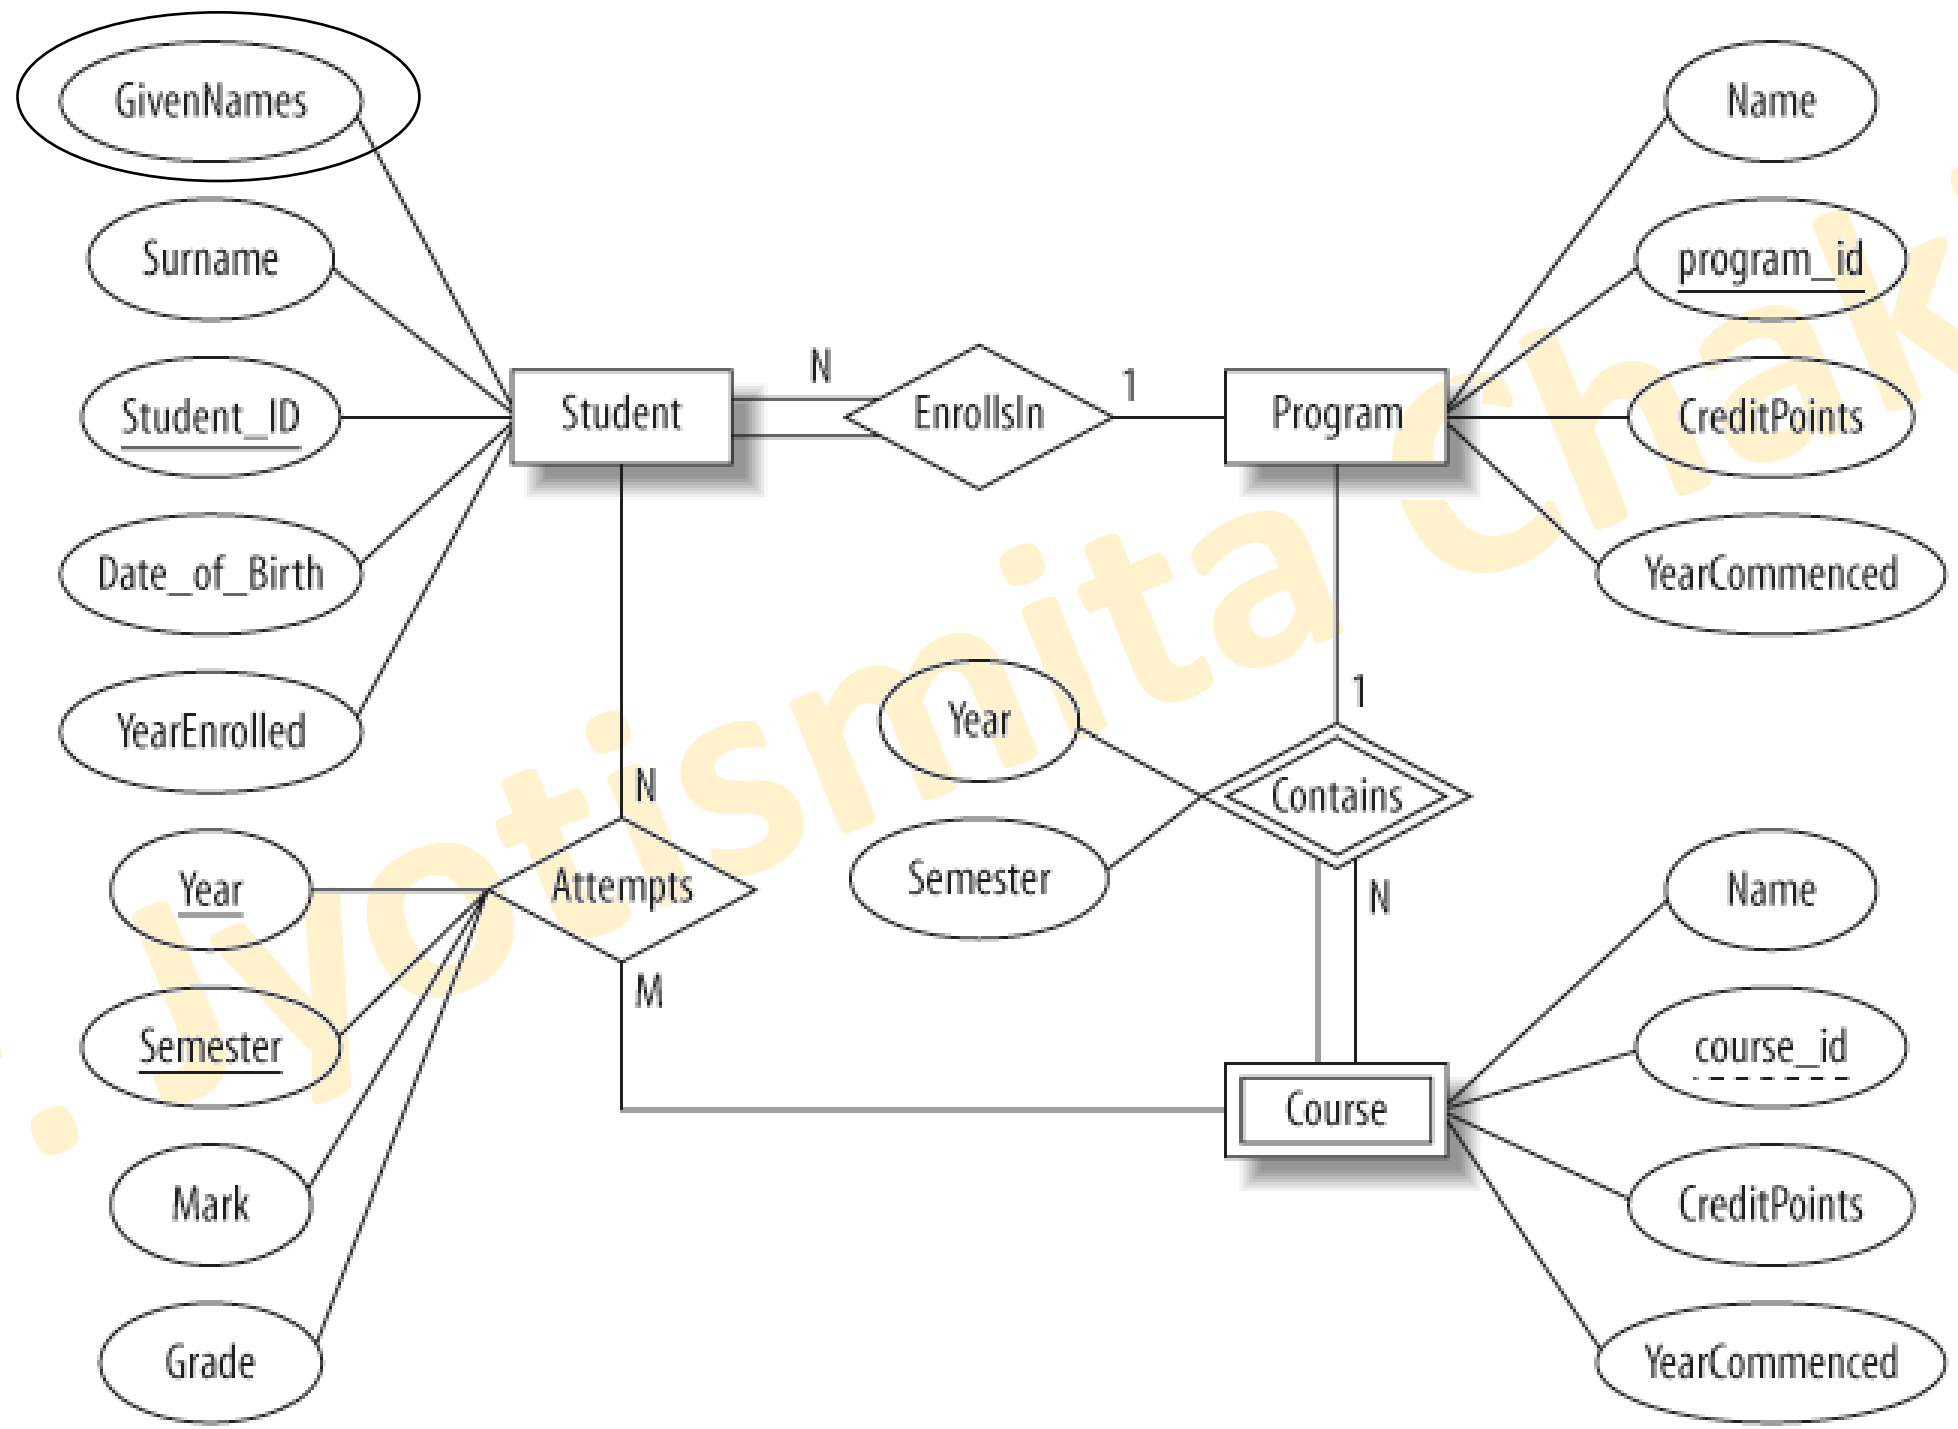

Solution

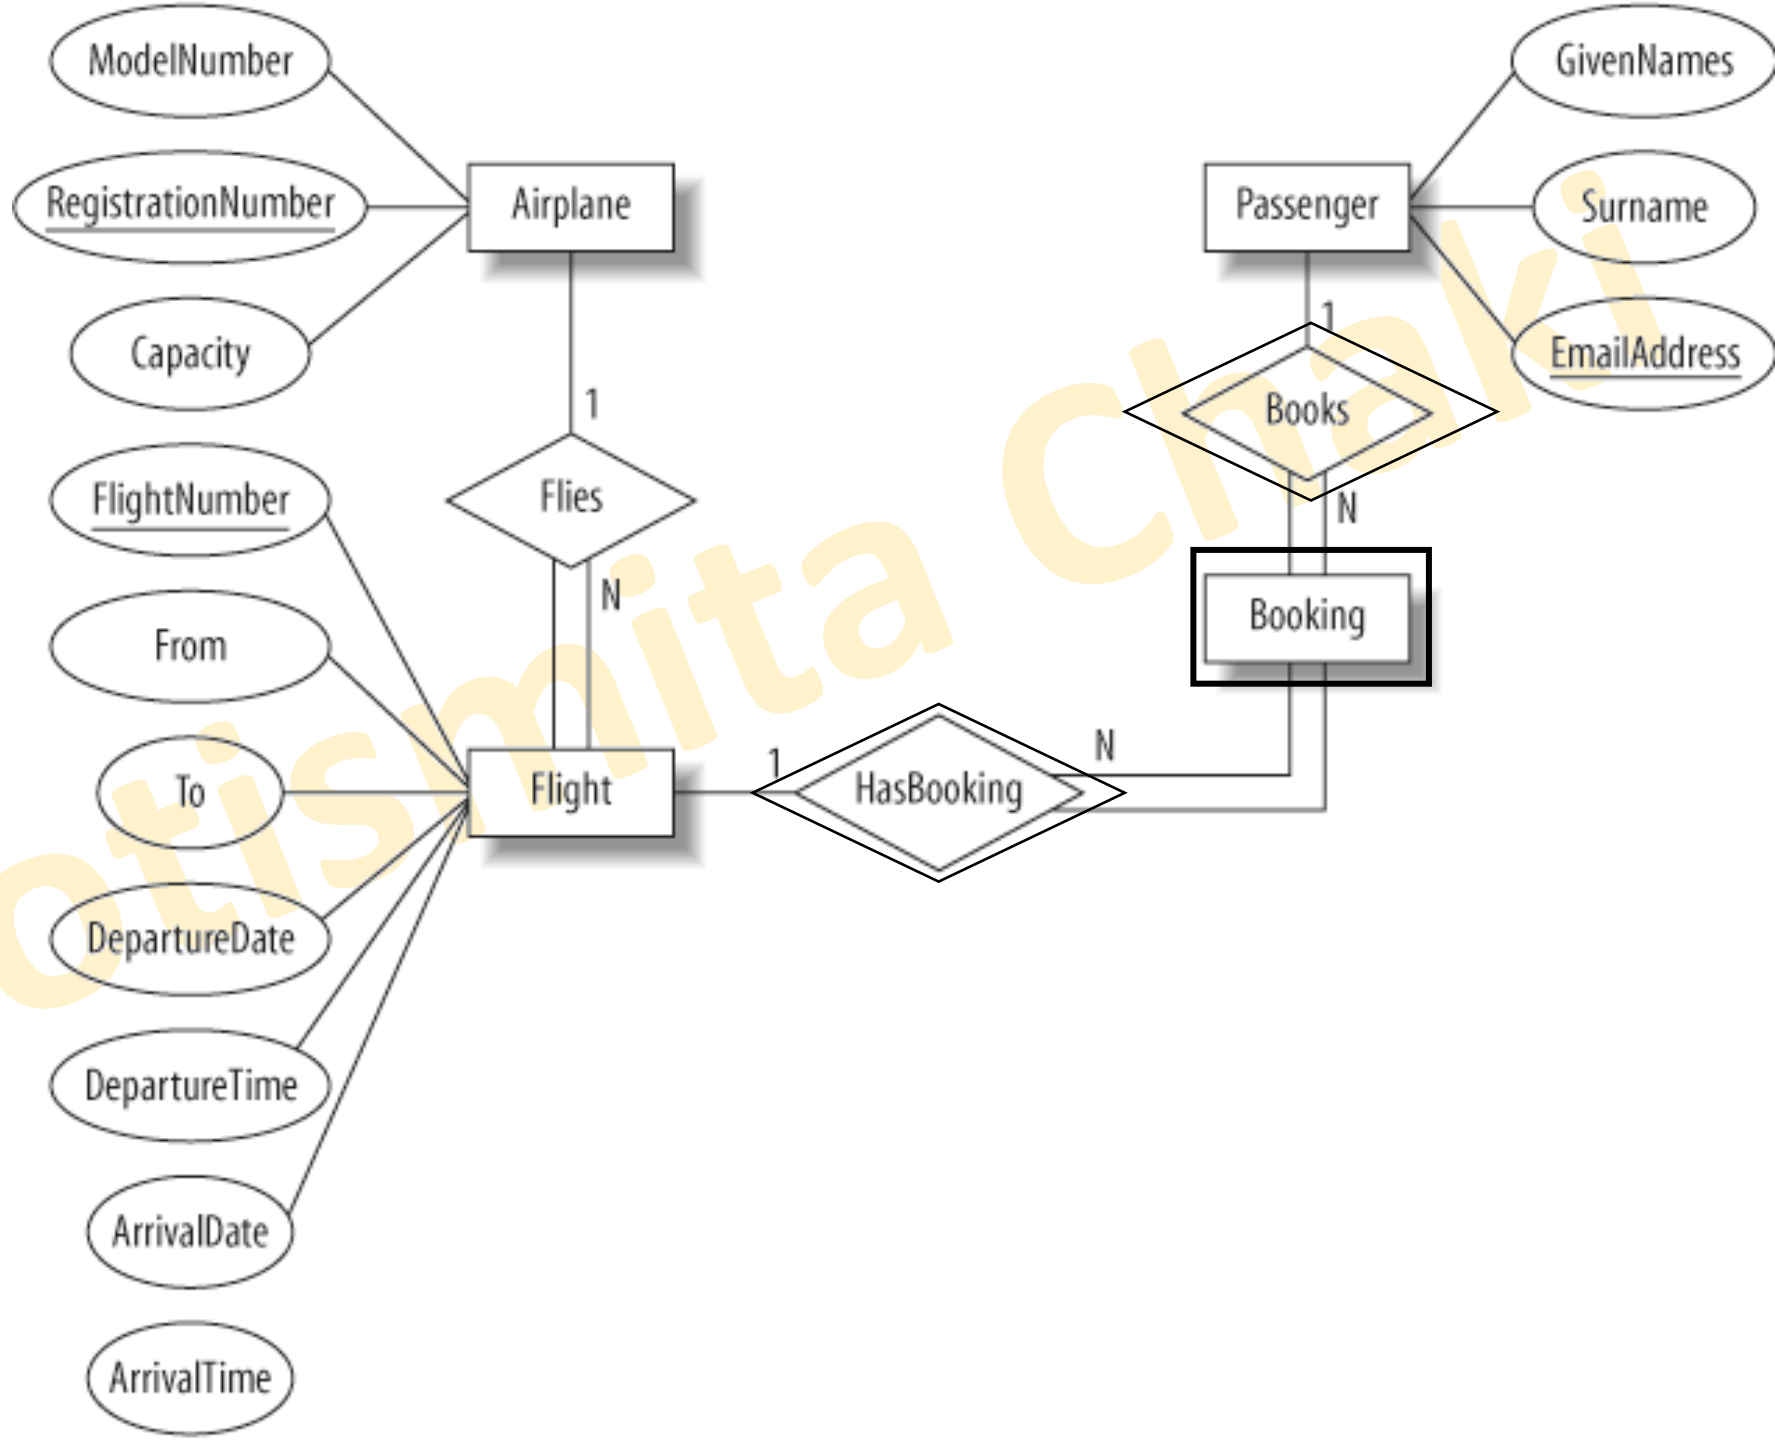

ER Diagram: 3

- Consider the following requirements list:
 - The university offers one or more programs.
 - A program is made up of one or more courses.
 - A student must enroll in a program.
 - A student takes the courses that are part of her program.
 - A program has a name, a program identifier, the total credit points required to graduate, and the year it commenced.
 - A course has a name, a course identifier, a credit point value, and the year it commenced.
 - Students have one or more given names, a surname, a student identifier, a date of birth, and the year they first enrolled. We can treat all given names as a single object—for example, “John Paul.”
 - When a student takes a course, the year and semester he attempted it are recorded. When he finishes the course, a grade (such as A or B) and a mark (such as 60 percent) are recorded.
 - Each course in a program is sequenced into a year (for example, year 1) and a semester (for example, semester 1).

Solution

ER to Relational Model: 1

Solution

- Step 1: Mapping of Regular Entity Types.

| Airplane | | |
|---------------------------|-------------|----------|
| <u>RegistrationNumber</u> | ModelNumber | Capacity |

| Flight | | | | | | |
|---------------------|------|----|---------------|---------------|-------------|-------------|
| <u>FlightNumber</u> | From | To | DepartureDate | DepartureTime | ArrivalDate | ArrivalTime |

| Passenger | | |
|---------------------|------------|---------|
| <u>EmailAddress</u> | GivenNames | Surname |

- Step 1: Mapping of Week Entity Types

| Booking | |
|---------------------|---------------------|
| <u>EmailAddress</u> | <u>FlightNumber</u> |

Solution

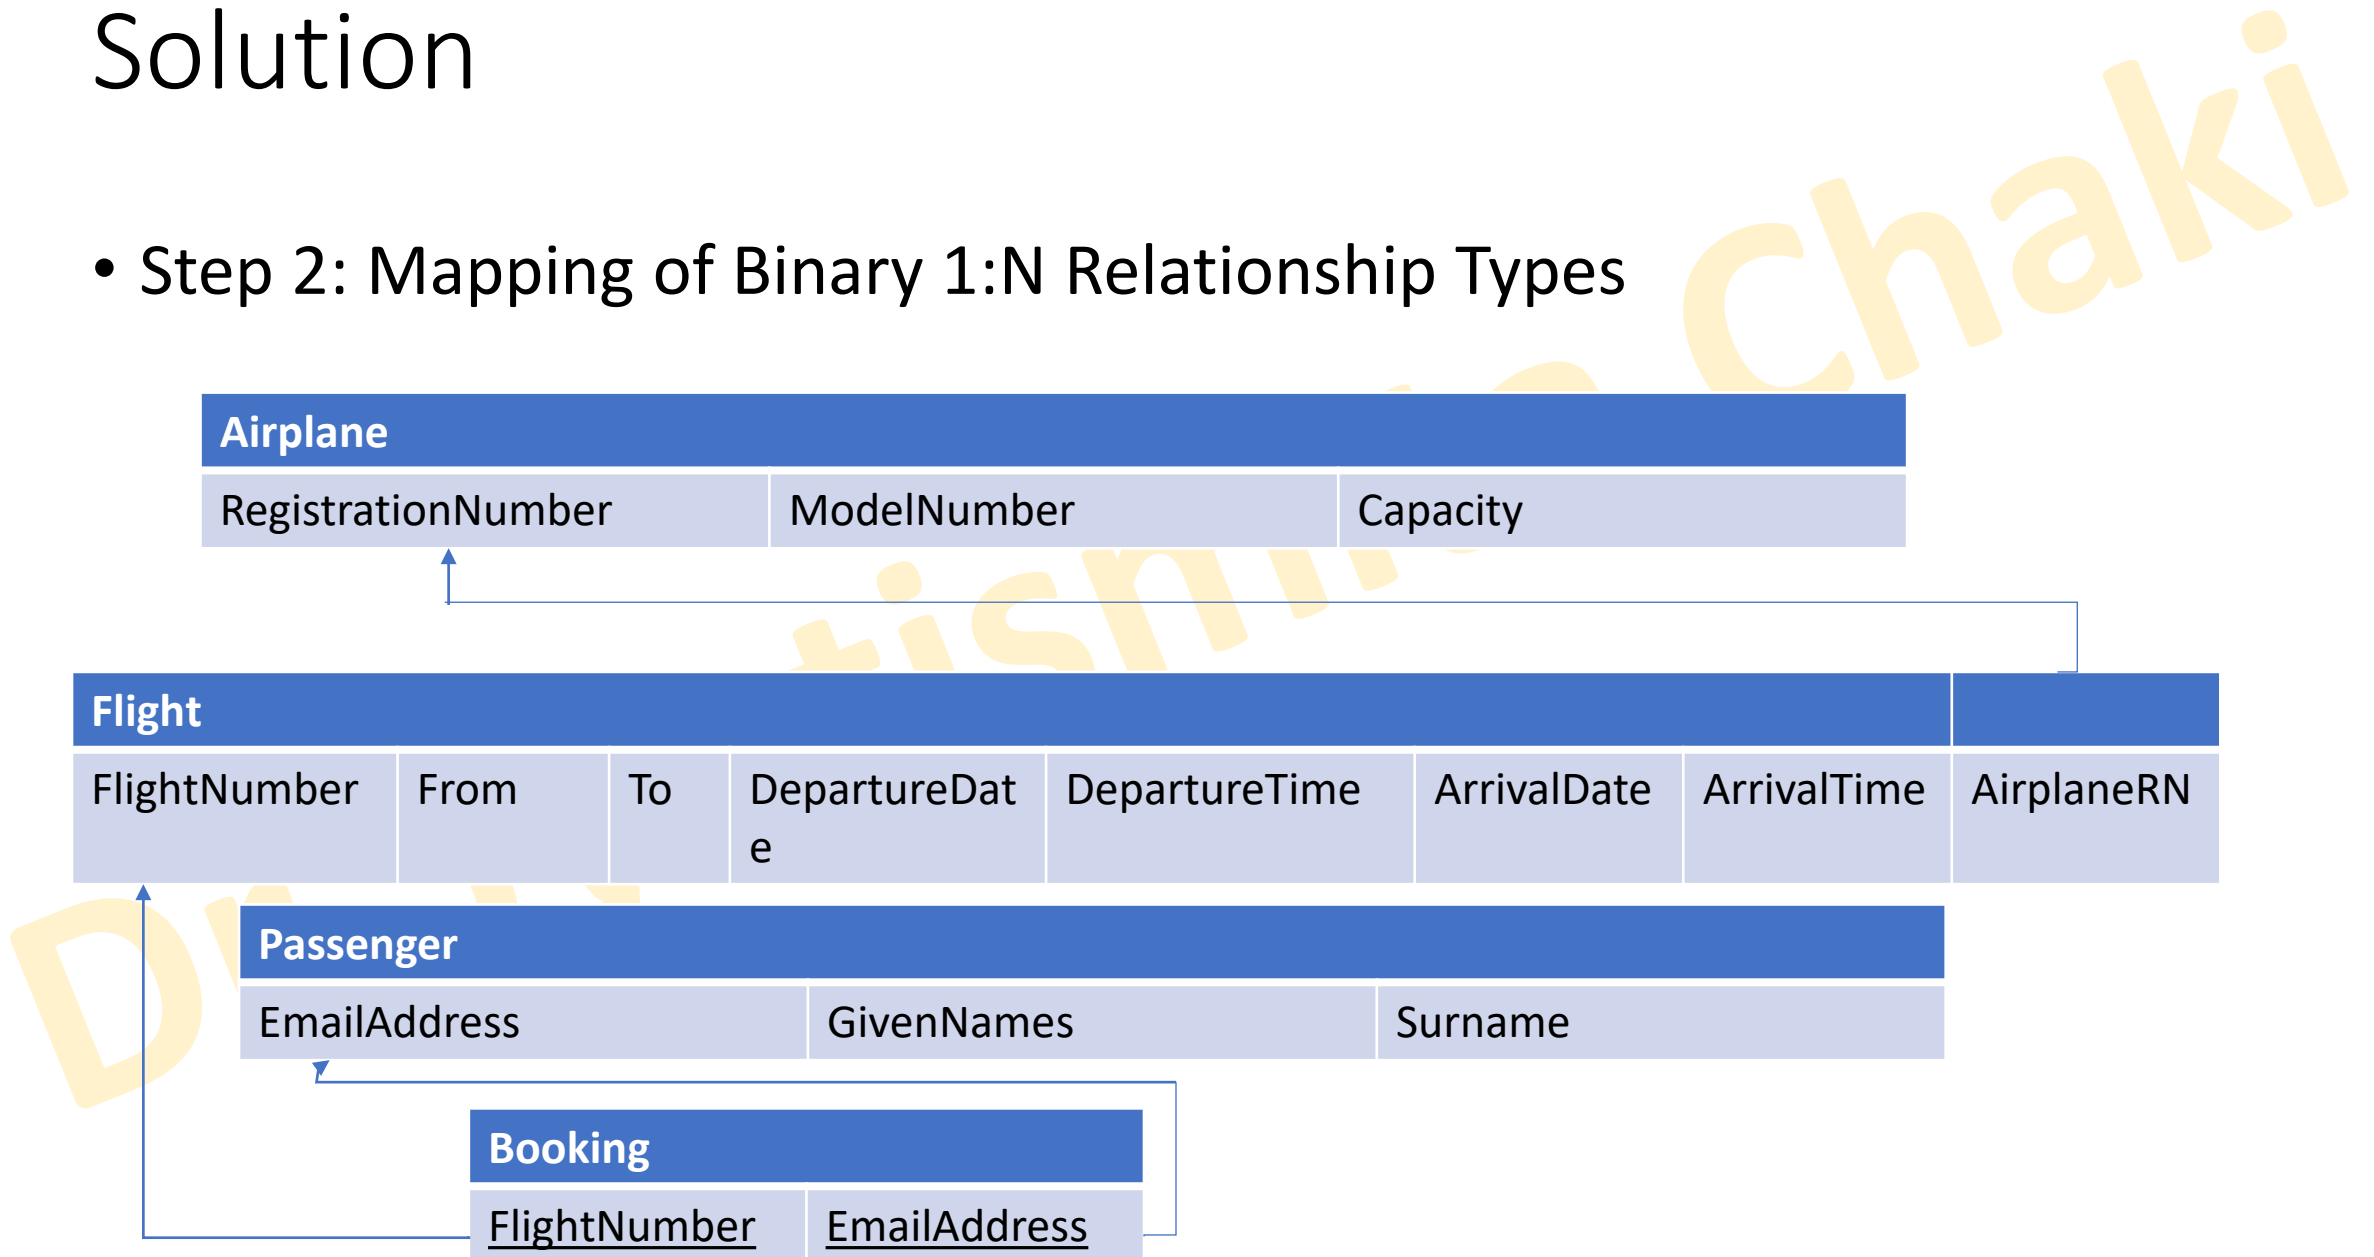

- Step 2: Mapping of Binary 1:N Relationship Types

| Airplane | | |
|--------------------|-------------|----------|
| RegistrationNumber | ModelNumber | Capacity |

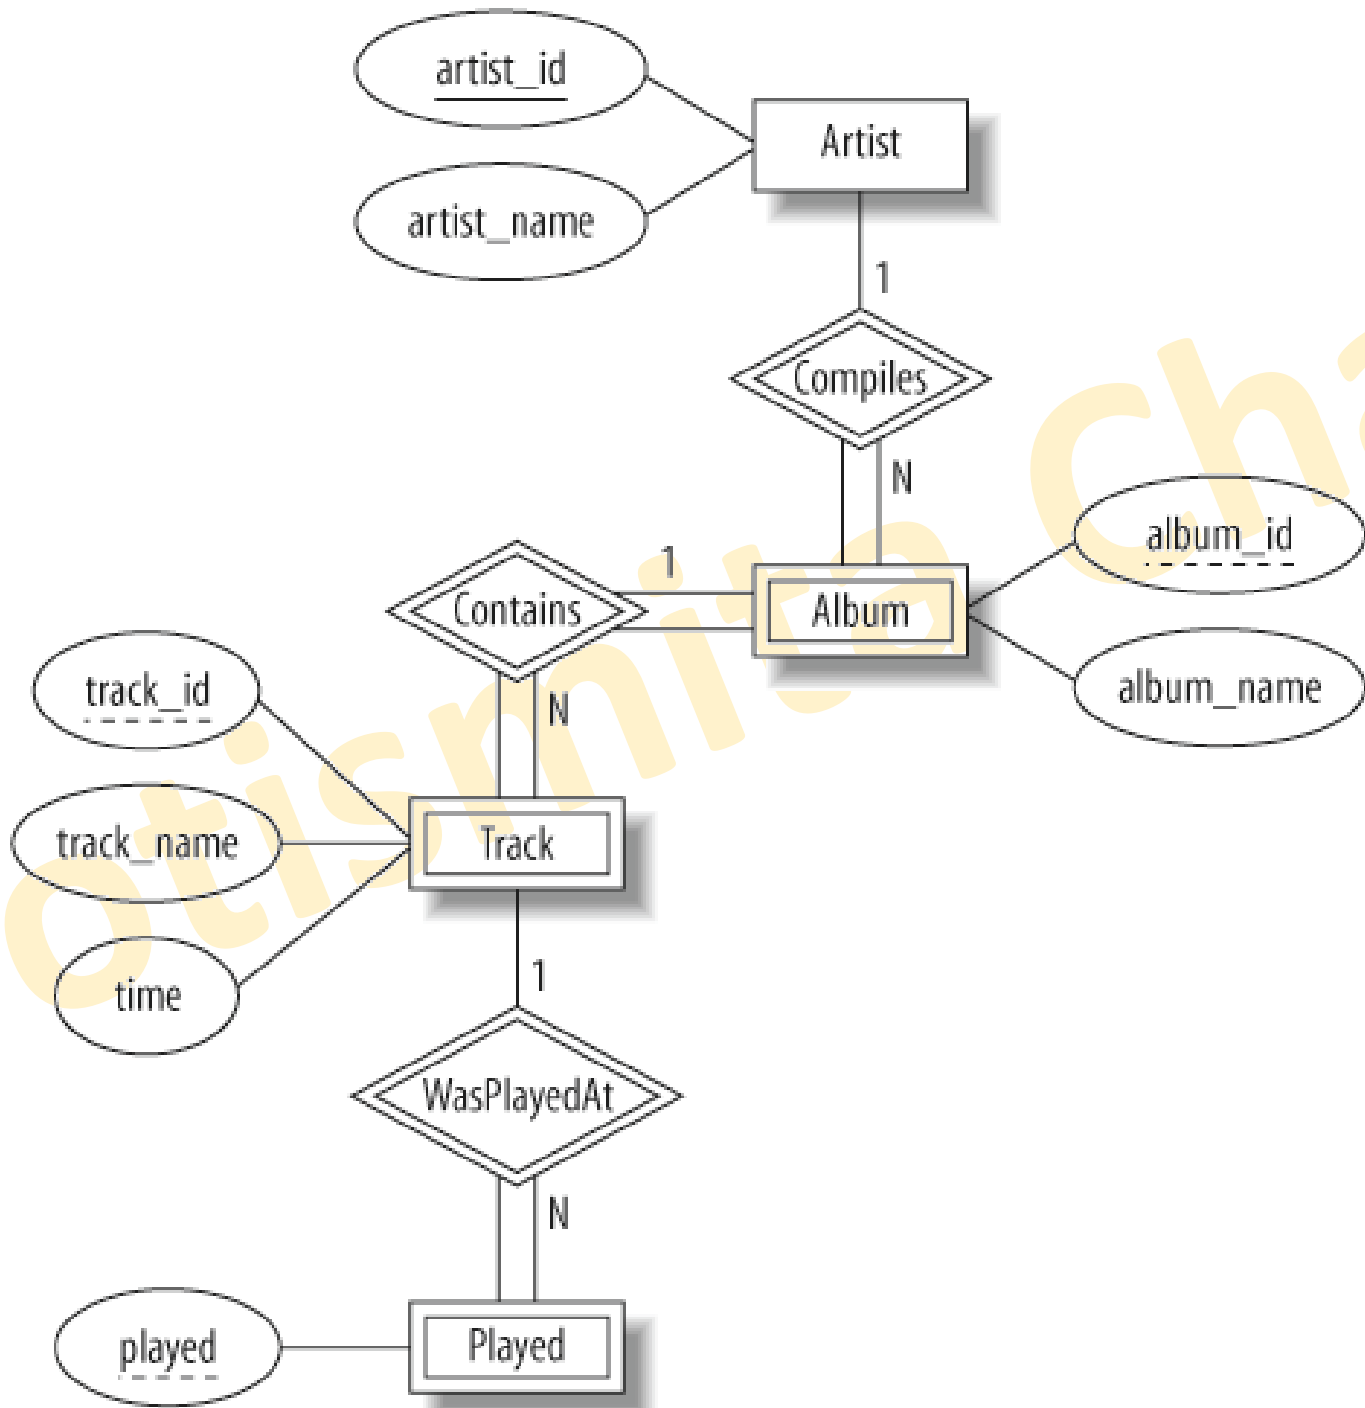

| Flight | | | | | | | |
|--------------|------|----|---------------|---------------|-------------|-------------|------------|
| FlightNumber | From | To | DepartureDate | DepartureTime | ArrivalDate | ArrivalTime | AirplaneRN |

| Passenger | | |
|--------------|------------|---------|
| EmailAddress | GivenNames | Surname |

| Booking | |
|---------------------|---------------------|
| <u>FlightNumber</u> | <u>EmailAddress</u> |

ER to Relational Model: 2

Solution

- Step 1: Mapping of Regular Entity Types

| Artist | |
|------------------|-------------|
| <u>Artist_ID</u> | Artist_Name |

- Step 2: Mapping of Weak Entity Types

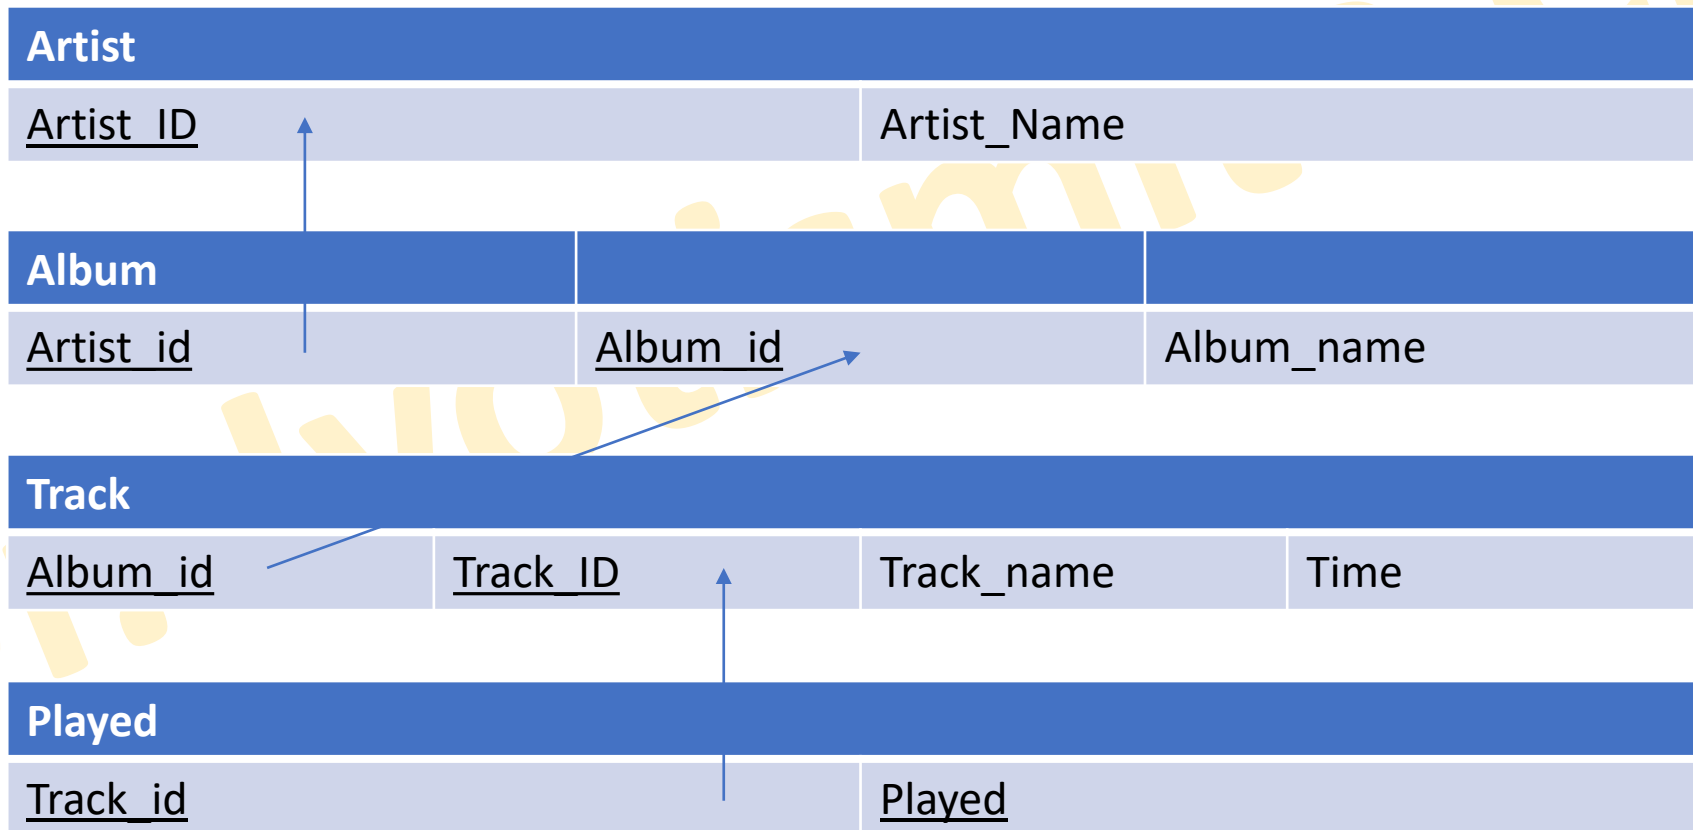

| Album | | |
|------------------|-----------------|------------|
| <u>Artist_id</u> | <u>Album_id</u> | Album_name |

| Track | | | |
|-----------------|-----------------|------------|------|
| <u>Album_id</u> | <u>Track_ID</u> | Track_name | Time |

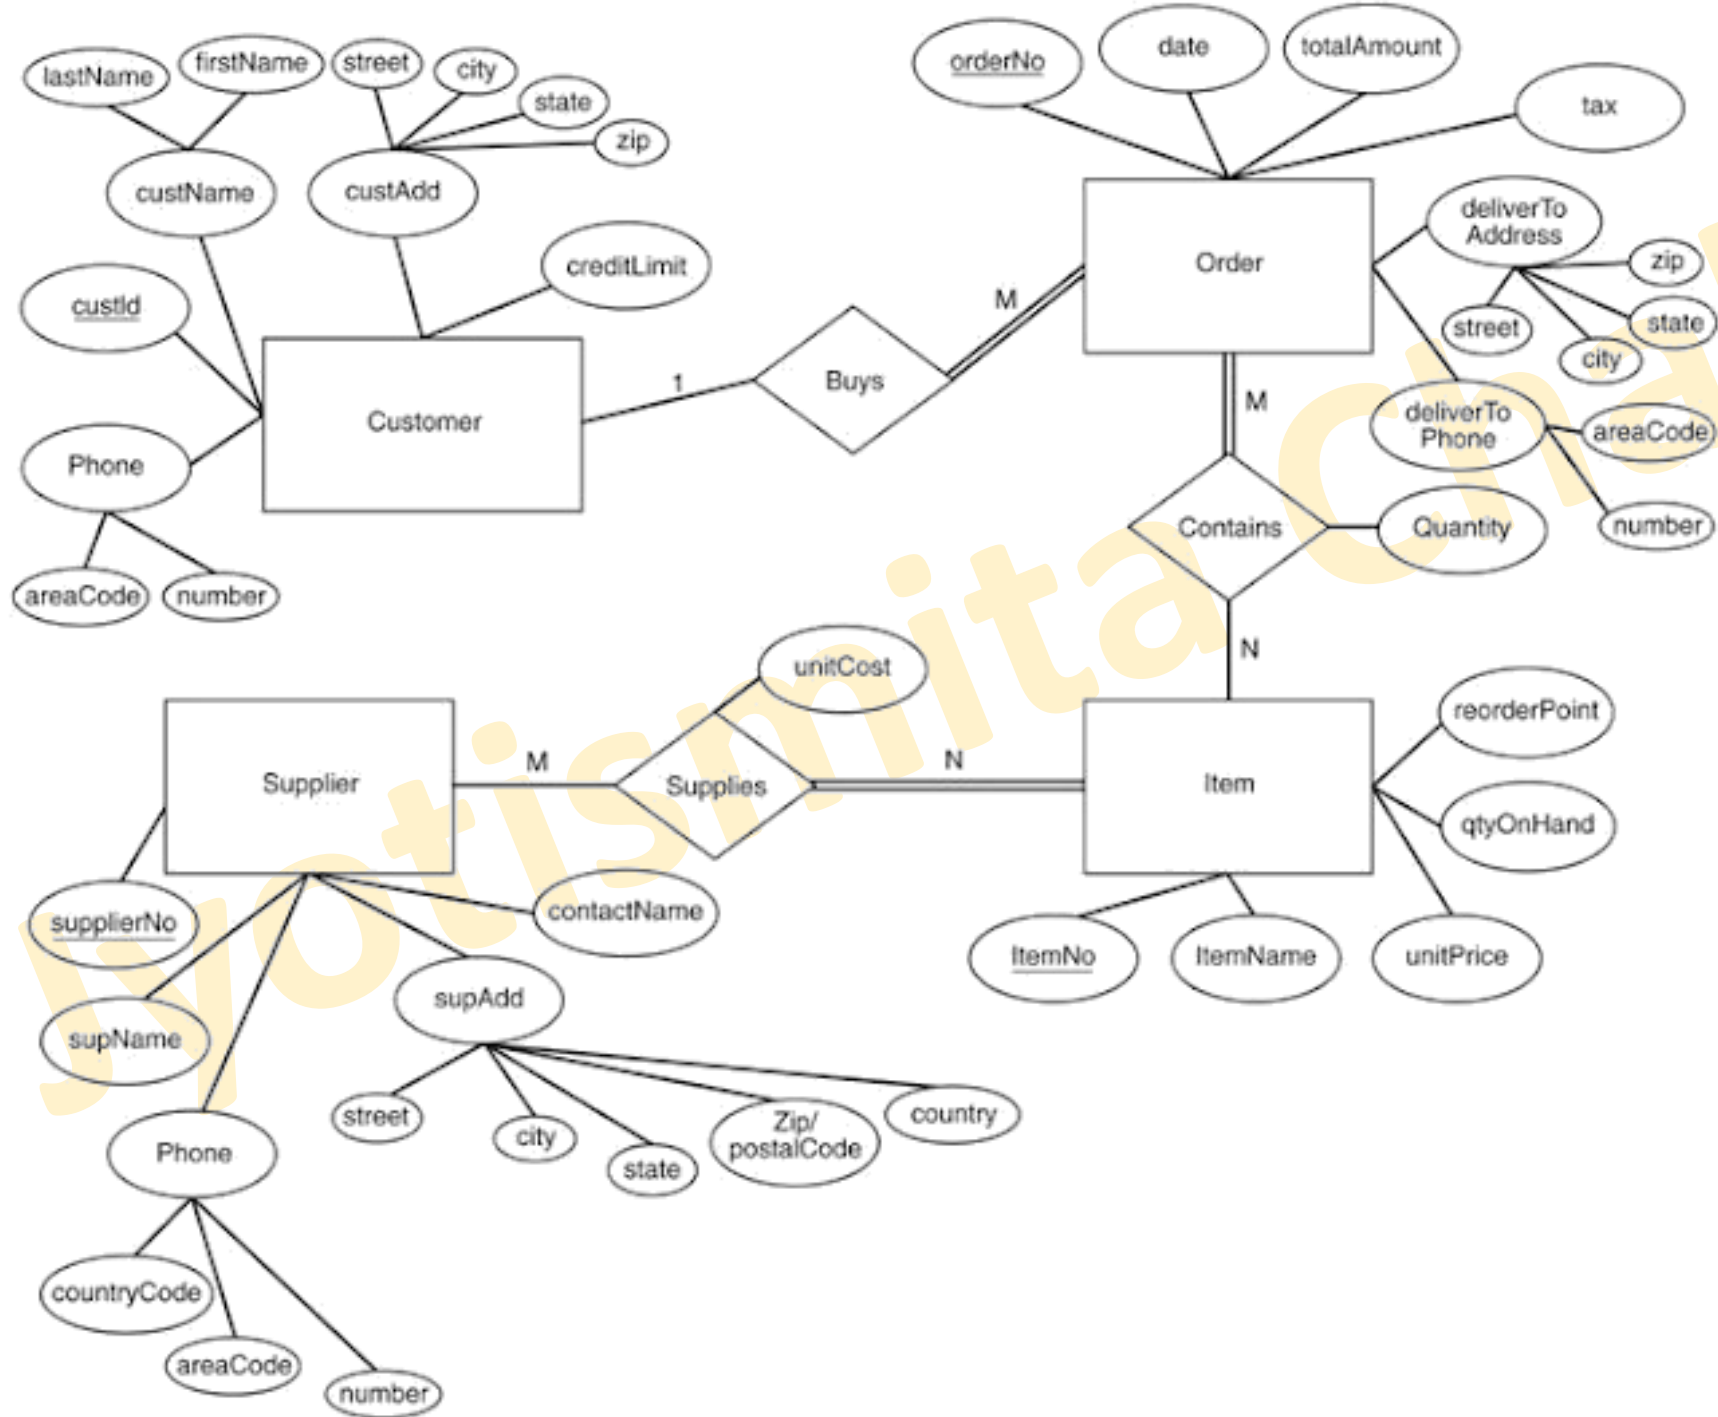

| Played | |
|-----------------|---------------|
| <u>Track_id</u> | <u>Played</u> |

Solution

- Step 2: Mapping of Binary 1:N Relationship Types

ER to Relational model: 3

Solution

- Customer (custID, lastName, firstName, street, city, state, zip, creditLimit, areaCode, number)
- Order (orderNo, date, totalAmount, tax, street, city, state, zip, areaCode, number, custId)
- Supplier (supplierNo, supName, street, city, state, zip, country, contactName, countryCode, areaCode, number)
- Item (ItemNo, ItemName, unitPrice, qtyOnHand, reorderPoint)
- Contains (orderNo, ItemNo, Quantity)
- Supplies (supplierNo, ItemNo, unitCost)

Normalization: 1

Primary Index: Dense

- Every value of the search key has a representative in a Dense Index.
- The index maintains the keys in the same order as in the data file.
- Primary Dense Index with Search Key=Account#.

| | | | | | |
|-------|--|--|----------|------------|---------|
| A-101 | | | Account# | Branch | Balance |
| A-102 | | | A-101 | Downtown | 500 |
| A-110 | | | A-102 | Perryridge | 400 |
| A-201 | | | A-110 | Downtown | 600 |
| A-215 | | | A-201 | Perryridge | 900 |
| A-217 | | | A-215 | Mianus | 700 |
| A-218 | | | A-217 | Brighton | 750 |
| A-222 | | | A-218 | Perryridge | 700 |
| A-305 | | | A-222 | Redwood | 700 |
| | | | A-305 | Round Hill | 350 |

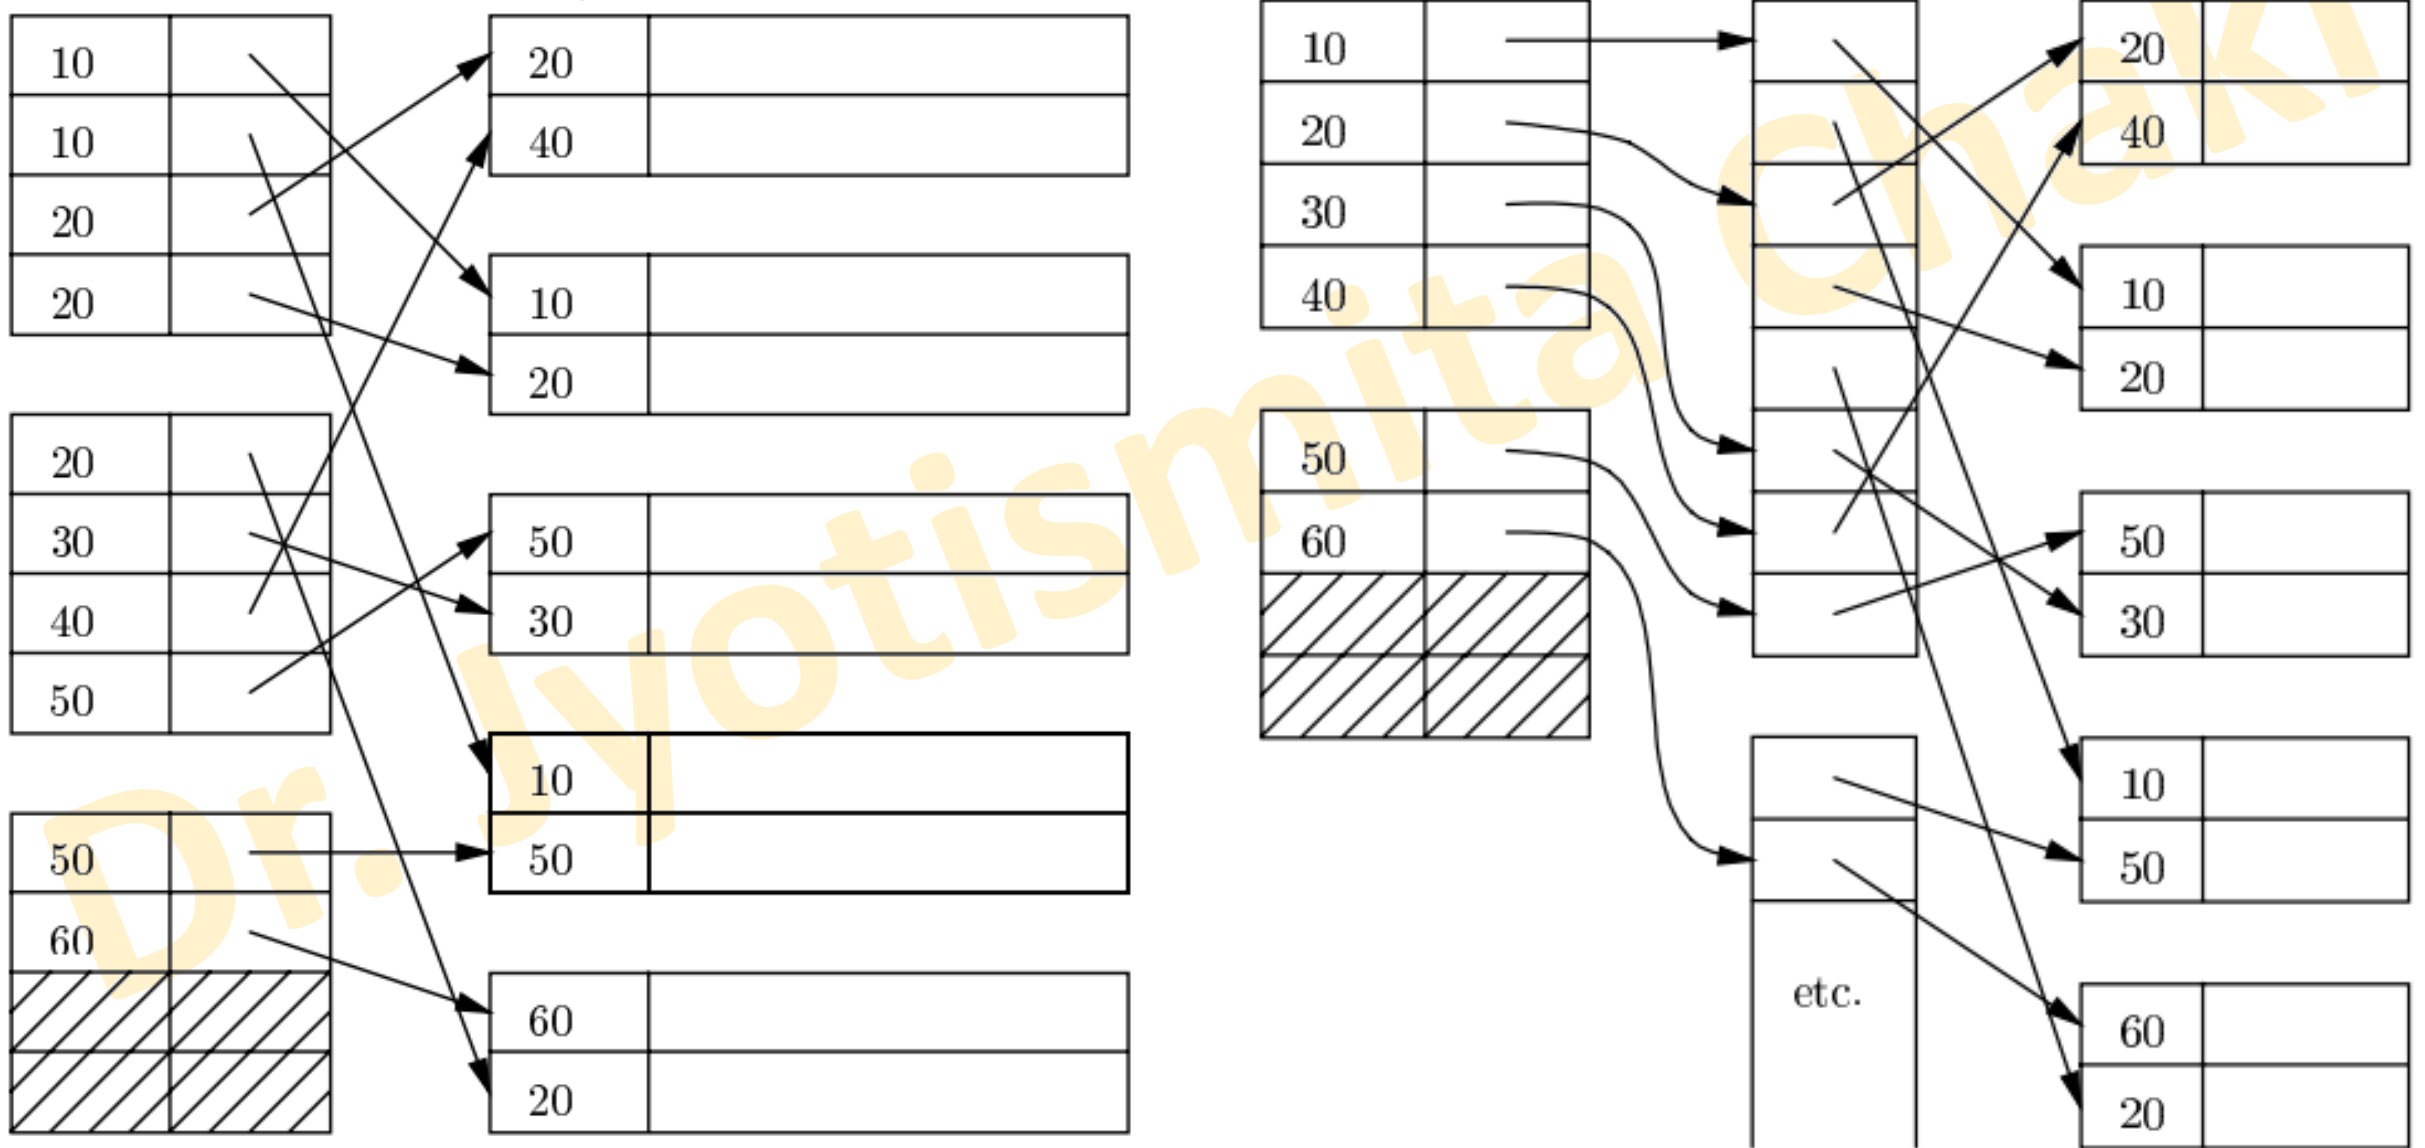

Primary Index: Sparse

- Used when dense indexes are too large: A Sparse Index uses less space at the expense of more time to find a record given a key.
- A sparse index holds one key-pointer pair per data block, usually the first record on the data block.
- Primary Sparse Index with Search Key=Account#.

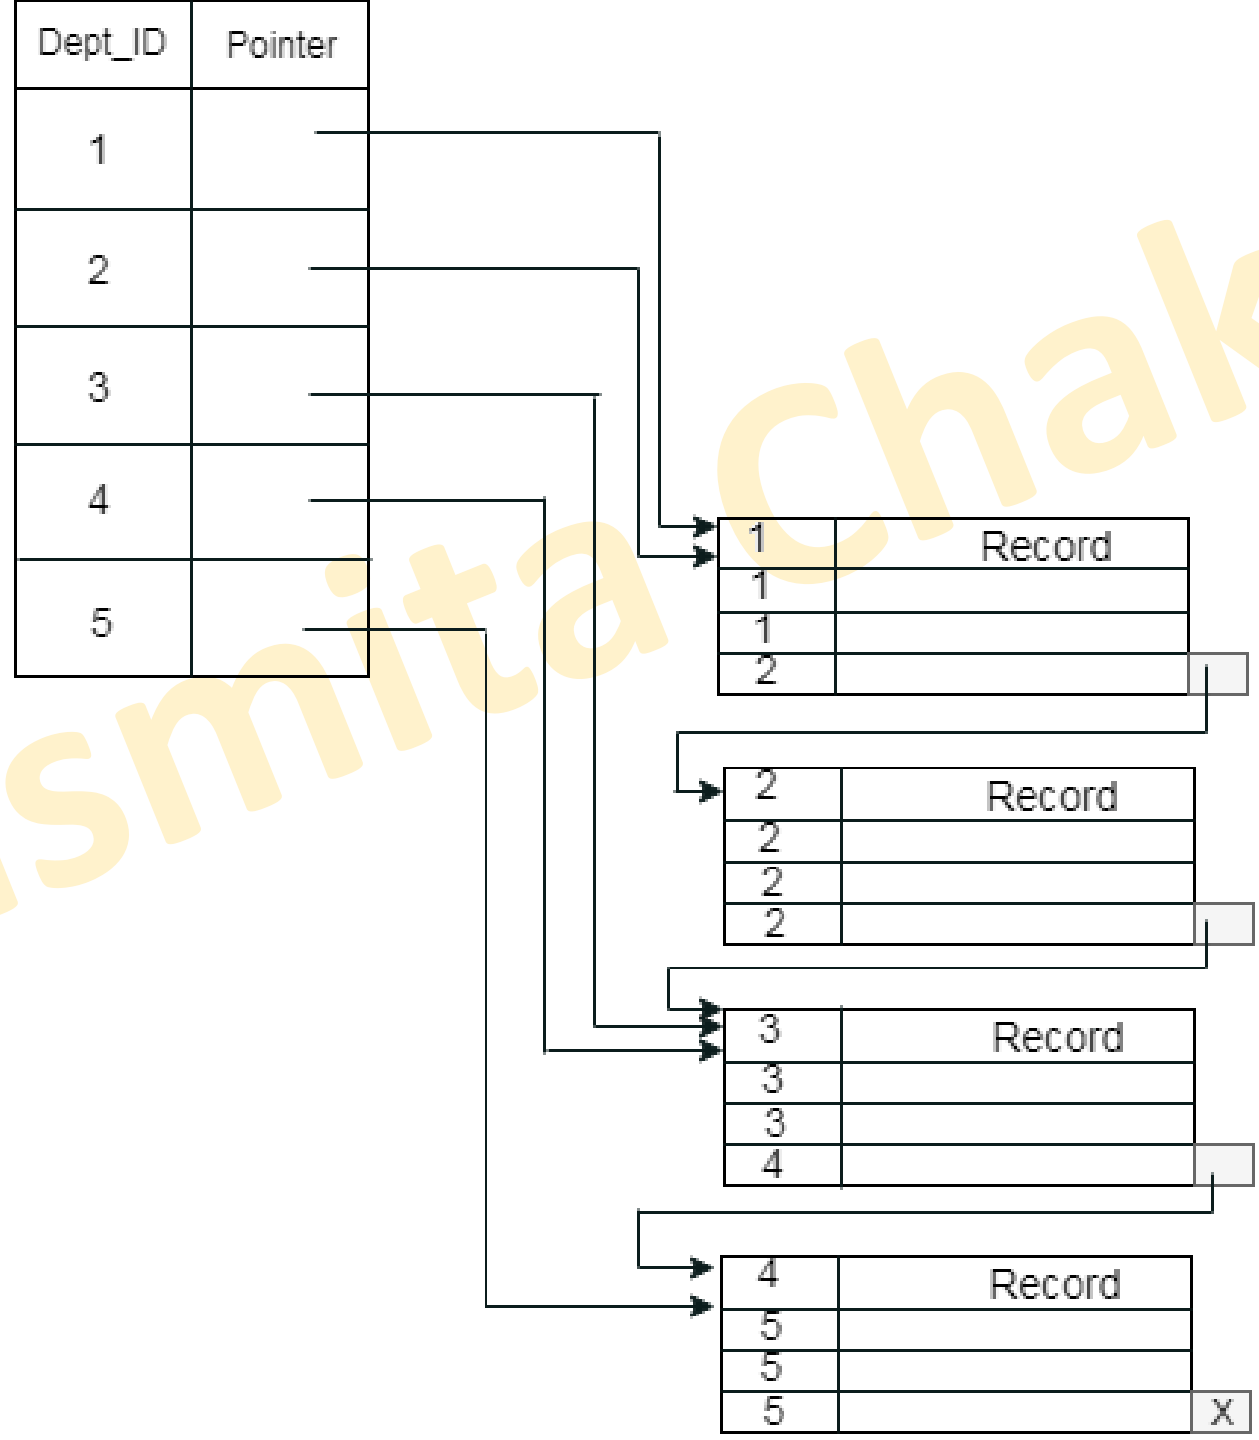

| | |
|-------|--|
| A-101 | |
| A-201 | |
| A-218 | |

| Account# | Branch | Balance |
|----------|------------|---------|
